Podocytopathy

If most Americans accept the notion that the market is the most efficient means to distribute resources, why should body parts be excluded? Each year thousands of people die waiting for organ transplants. Many of these deaths could have been prevented were it not for the almost universal moral hand-wringing over the concept of selling human organs. Kidney for Sale by Owner, now with a new preface, boldly reasserts the case that health care could be improved and lives saved by introducing a regulated transplant organs market rather than by well-mean, but misguided, prohibitions.

Human Nutrition

For many years, there has been a great deal of work done on chronic congestive heart failure while acute heart failure has been considered a difficult to handle and hopeless syndrome. However, in recent years acute heart failure has become a growing area of study and this is the first time it has been extensively the diagnosis and management of this complex condition. The book reflects the considerable amount of new data reported and many new concepts which have been proposed in the last 3-4 years looking at the epidemiology, diagnostic and treatment of acute heart failure.

Geriatrics for Specialists

Despite our efforts at creating clinical performance measures, clinical practice guidelines and intense government regulations, we still have disparities in care, poor outcomes and quality that is inferior to many other nations. Bundling and payment reform challenge the ability to deliver good care to patients even further. Chronic dialysis is at a crossroads. Physicians and providers must incorporate new approaches, reinventing the paradigm of how to plot the course of patient therapy. This book offers new ideas. It is refreshing, timely and engaging, with a wide range of topics by leading authors, each designed to help meet the challenges yet to come.

"This is a book about living solid organ donors as patients in their own right. This book is premised on the supposition that the field of living donor organ transplantation is ethical, even if some specific applications are not. Living donor organ transplantation is controversial at its core because it exposes one patient (the living donor) to clinical risks for the clinical benefit of another (the cadaveric recipient). It is different from obstetrics which also involves 2 patients—a pregnant woman and her fetus— because transplantation involves two physically individuated patients who, in most cases, individually consent to the medical interventions. And in many cases, the donor-recipient interdependence is optional because deceased donor organs may be available. So before one can begin, one must ask, even if only rhetorically: Is living donation ethical? The question is not new: one of the first to ask about the ethics of living donor transplantation was Joseph Murray, the surgeon credited with performing the first successful living donor kidney transplant which must ask, even if only rhetorically: Is living donation ethical? Acute Heart Failure

Kidney Disease, Repair and Regeneration focuses on the molecular and cellular basis of kidney disease, exploring the origins of kidney disease, the development of kidney tissue subcompartments, as well as the genetic and environmental regulation of kidney development. Special coverage is given to kidney cell renewal and possible stem cells towards kidney repair and regeneration. Emphasis is placed on the fetal origins of postnatal renal disease and our current understanding of the molecular basis of damage and repair. Biomedical research in experimental nephrology and developmental biology will find this a key reference for learning how the underlying developmental mechanisms of the kidney will lead to greater advances in regenerative medicine within nephrology. Offers researchers a comprehensive resource written by leaders from both the developmental biology and the experimental nephrology communities focusing on understanding the role of the molecular mechanisms as well as how the molecule can be affected both genetically and environmentally. Explains the underlying developmental mechanisms which influence the kidney’s inherent repair capacity. Demonstrates how a deeper understanding of mechanisms will lead to greater advances in regenerative medicine.

Issues in Kidney Disease

Kidney transplantation is a complex field that incorporates several different specialties to manage the transplant patient. This book was created because of the importance of kidney transplantation. This volume focuses on the complexities of the transplant patient. In particular, there is a focus on the morbidities and special considerations for a transplant patient and how they affect kidney transplant outcomes. Contributors to this book are from all over the world and are experts in their individual fields. They were all individually approached to add a chapter to this book and with their efforts this book was formed. Understanding the Complexities of Kidney Transplantation gives the reader and excellent foundation to build upon to truly understand kidney transplantation.

Kidney Failure and the Federal Government

Kidney Transplantation, Bioengineering, and Regeneration: Kidney Transplantation in the Regenerative Medicine Era investigates how the field of regenerative medicine is changing the traditional premises of solid organ transplantation, specifically within the field of kidney transplantation. In Section I, chapters illustrate the state of the art in kidney transplantation and all the research behind the bioengineering and regeneration of kidney organs for therapeutic renal replacement. In Section II, chapters catalog the technologies that are being developed and the methods that are being implemented to bioengineer or regenerate kidneys in order to restore function, while critically highlighting those technological advances which hold the most promise. The book thus encompasses clinical renal transplantation, tissue engineering, biomaterial sciences, stem cell biology, and developmental biology, as they are all applied to the kidney. Focused on the synergy between renal organ transplantation and regenerative medicine, highlighting the advances within transplantation, bioengineering, regeneration, and repair, educates the transplant community on important regenerative medicine research pertinent to kidney transplantation. Develops a shared language for clinicians, surgeons, and basic researchers to reach across the fields of transplantation and regenerative medicine, and facilitates more productive investigation and research. Catalogs the technologies being developed and methods being implemented to bioengineer or regenerate kidneys to restore function.

Diseases of the Abdomen and Pelvis

This new volume deals with a number of important and current topics in human nutrition that we hope will be of general interest to those concerned with this subject. We have first of all a chapter by J. S. Garrow and S. Blaza on energy requirements, which has a direct bearing on the problem of obesity, and which largely affects the populations of developed and affluent countries. This is followed by a chapter on fluorine and the fluoridation of water, under the authorship of G. N. Jenkins. The addition of fluorine to drinking water has given rise to a great deal of discussion both amongst scientists and the public at large, and the present account tries to give the scientific background and a critical evaluation of established facts. The chapter by G. Owen on the nutritional status of North Americans is also likely to be of interest to other countries, as the techniques used and the problems encountered are similar to those encountered in other parts of the world. A chapter on nitrates, nitrites and nitrosamines by S. R. Tannenbaum discusses a topic which again has engendered widespread interest amongst a large number of people, and where a balanced presentation of the relevant facts is particularly important. One of the fields in which chemistry, physiology and nutrition have made enormous advances over the last few years is that of vitamin D and the new knowledge acquired on control of the metabolism of calcium and phosphorous.

Nutrition: Concepts and Controversies

A timely update Acute kidney injury (AKI) is a serious and as yet incompletely understood disorder in which sudden impairment of kidney function occurs secondary to one or more of a variety of underlying conditions. This disorder is very common in (elderly) ICU patients and is associated with very high mortality. Many of those who survive suffer from permanent kidney failure and other long-term morbidities, which may include cardiovascular disease and immune dysfunction. Epidemiologic evidence suggests that AKI is not a single disease, but a syndrome characterized of multiple, often coexisting, etiologies forming usually part of multiple organ failure syndrome, it calls for multiple organ support therapy. The publication at hand contains sections on prerenal azotemia syndrome, dying of or with AKI, pathophysiology of sepsis-induced acute kidney injury, developments in prevention / treatment / rehabilitation, and renal support. Reporting the latest recommendations from experts, it provides valuable information for those that are interested in understanding the disorder and its treatment options.

Ethical Issues in Pediatric Organ Transplantation

"Kidney disease is frequently described as a public health problem. This book will unpack what we mean by "public health" and by "taking a public health approach." We will consider the global burden of kidney diseases and their determinants, with a focus on chronic kidney disease."

Controversies in Acute Kidney Injury

Since laboratory testing and biomarkers are an integral part in the diagnosis and treatment of kidney disease, Kidney Biomarkers: Clinical
Aspects and Laboratory Determination covers currently used biomarkers as well as markers that are in development. Laboratories are increasingly using these in the future. Among the non-communicable diseases, cardiovascular disorders are the leading cause of morbidity and mortality in both the developed and the developing countries. The spectrum of risk factors is wide and their understanding is imperative to prevent the first and recurrent episodes of myocardial infarction, stroke or peripheral vascular diseases which may prove fatal or disabling. This book has tried to present an update on risk factors incorporating new research which has thrown more light on the existing knowledge. It has also tried to highlight regional diversity addressing such issues. It will hopefully be useful to the cardiologists, general practitioners, family physicians, researchers, graduate students committed to cardiovascular risk prevention.

Issues and Controversies on File

In Kidney to Share, Martha Gershun tells the story of her decision to donate a kidney to a stranger. She takes readers through the complex process by which such donors are vetted to ensure that they are physically and psychologically fit to take the risk of a major operation. John D. Lantos, a physician and bioethicist, places Gershun’s story in the larger context of the history of kidney transplantation and the ethical controversies that surround living donors. Together, they help readers understand the discovery that made transplantation relatively safe and effective as well as the legal, ethical, and economic policies that make it feasible.
the burdens that we place on people who are willing to donate. In this raw and vivid book, Gershun and Lantos ask us to consider just how far society should go in using one person’s healthy body parts in order to save another person. Kidney to Share provides an account of organ donation that is both personal and analytical. The combination of perspectives leads to a profound and compelling exploration of a largely opaque practice. Gershun and Lantos pull back the curtain to offer readers a more transparent view of the fascinating world of organ donation.

**Kidney Transplantation, Bioengineering, and Regeneration**

Is the nephrology community facilitating excess cardiovascular deaths in patients with kidney failure and anemia by treating to a subnormal hematocrit? Why have clinicians and nephrologists permitted health insurance companies and the government to decide when anemia therapy should begin in persons with progressive kidney failure? Is the only variable that can be manipulated to maximize response to regression in chronic kidney disease (CKD)? Are we using too much intravenous iron in kidney failure patients, and is oral iron supplementation worthless in sustaining iron stores during long-term erythropoietin treatment? When does left ventricular hypertrophy begin to emerge in patients with progressive renal disease and is there convincing evidence that anemia is a significant cause of LVH in this setting? Is darbepoetin alfa, a new recombinant erythropoietin, really superior to recombinant human erythropoietin? This book is a compilation of proceedings from a conference in Brooklyn convened to address these and other controversial and unresolved issues in renal anemia management.

Kidney Development, Disease, Repair and Regeneration

This book aims to be a single point of reference for advances in the care of geriatric populations across medical and surgical specialties. The aging population is a unique demographic with its own health challenges. Geriatricians are specifically trained to address these challenges but few medical students or residents enter geriatrics, even as the demand for geriatric expertise increases. The practices of many medical and surgical specialists are dominated by older patients who may themselves see many specialists but rarely visit geriatricians. This updated edition elucidates the most common medical conditions seen in aging patients and translates approaches to those conditions for physicians across specialties. Divided into three sections that assemble crosscutting issues, medical specialties, and surgical and related specialties, this book serves as a guide for clinicians of all backgrounds who will work with older patients as the demographic ages further. This second edition of Geriatrics for Specialists expands the number of specialist chapters to reflect growth in research in aging and clinical care for older people in dermatology, plastic surgery, and behavioral neurology. All original chapters from the first edition are extensively revised and updated to reflect the rapid growth of new knowledge in the field.

Pediatric Critical Care

The here presented book covers different areas of clinical and scientific interest, reaching from donor evaluation to newest methods in immunological diagnostics. But also aspects of daily care of transplant recipients can be found in the carefully selected chapters. Everything driven by the aim to improve the care for all of our transplanted patients.
